<u>Course Title:</u> Microprocessor and Interfacing Sessional (CSE-3812)

Department of Computer Science and Engineering (CSE) **Dhaka University of Engineering & Technology (DUET), Gazipur**

Lab # 06

Understanding Advanced 8086 I/O Instructions using Array and String in Assembly Language Program.

Theory:

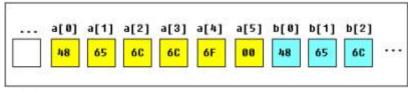

Array:

Arrays can be seen as chains of variables. A text string is an example of a byte array; each character is presented as an ASCII code value (0..255). Some array definition examples are as follows:

```
a DB 48h, 65h, 6Ch, 6Ch, 6Fh, 00h b DB 'Hello', 0
```

b is an exact copy of the a array, when compiler sees a string inside quotes it automatically converts it to set of bytes. This chart shows a part of the memory where these arrays are declared:

You can access the value of any element in an array using square brackets, for example:

MOV AL, a[3]

You can also use any of the memory index registers BX, SI, DI, BP, for example:

```
MOV SI, 3
MOV AL, a[SI]
```

If you need to declare a large array with same value you can use **DUP** operator. The syntax for **DUP**: For example:

```
c DB 5 DUP(0)
c DB 0, 0, 0, 0, 0 ; is an alternative way of
```

declaring one more example:

```
d DB 5 DUP(1, 2)
d DB 1, 2, 1, 2, 1, 2, 1, 2 ; is an alternative way of declaring
```

one more example:

```
line DB 5, 4, 3 DUP ( 2, 3 DUP ( 0), 1) which is equivalent to line DB 5,4,2,0,0,0,1,2,0,0,0,1,2,0,0,0,1
```

Of course, you can use **DW** instead of **DB** if it's required to keep values larger then 255, or smaller then -128. **DW** cannot be used to declare strings!

<u>String:</u>

• String Display Instruction

At first define the string to be displayed under DATA SEGMENT:

.DATA

```
test string DB 'My first string', 0Dh, 0Ah, '$'
```

Then, display the string in the command prompt as:

```
MOV AH, 9
LEA DX, test_string
INT 21h
```

Assembly Language Program Example 1 for Array:

Replace each lowercase letter in the following string by its upper case equivalent.

msg DB 'this is a message'

org 100h TOP: .DATA; Data segment starts cmp message[si],'' je next message db 'this is a message:\$' ;1-D array for and message[si], 0dfh string .CODE; Code segment starts MAIN PROC next: mov ax, @DATA inc si mov ds, ax loop top lea dx, message lea dx, message mov ah, 09h; display string function mov ah, 09h; display string function int 21h; display message int 21h; display message mov ah, 02h mov ah, 4ch mov dl, 0Dh int 21h int 21h MAIN ENDP END MAIN mov dl, 0Ah int 21h RET mov cx, 17 xor si, si

Assembly Language Program Example 2 for Array:

To find summation of a series 1 + 2 + 3 + ... + N using array. Here, value of N is given by user where N=3 and output is shown in the output window:

```
org 100h
.DATA; Data segment starts
A db 3, 1, 2;1-D array for number B db 00h
message db 'Enter the value of N:$' ;1-D array for string
.CODE; Code segment starts
MAIN PROC
  mov ax, @DATA
  mov ds, ax
  xor ax,ax
  mov si, OFFSET A
  mov di, OFFSET B
  mov dx, OFFSET message; Load Effective Address of the message in DX register
  ; lea dx, message ; (similar meaning like Load Effective Address)
  mov ah, 09h
                                              ;display string function
                                             ;display message
  int 21h
  mov ah, 01h
  int 21h
  mov cl, al
                        ; to convert the ascii value of 3 to decimal
  sub cl, 48
  3 xor al, al
  Loop 1:
       add al, [si]
       inc si
       loop Loop_1
 mov bl, al
  add bl, 48
                       ; to convert the ascii value of the output to decimal
 mov ah, 02h
  mov dl, 0Dh
  int 21h
```

mov dl, 0Ah int 21h mov dl, bl int 21h mov ah, 4ch int 21h MAIN ENDP END MAIN RET

Tasks to do:

1. Write an assembly language program that stores a string in a variable. Now, first display the whole string and then display the first small letter and last small letter in the string. If no small letters are entered, then display "No small letters".

Sample Input / Output:

Input in a String: input_string DB 'WE aRE DUET STuDeNTs', 0Dh, 0Ah, '\$' Output: a

S

2. Write an assembly language code to derive the final value of the number sequence 1²+2²+3²+4²+.....+N². (use ARRAY and Loop). Take the input value of N (in between 2 to 9) as a single ASCII character and then adjust it to actual decimal value in your program. Finally, store and show the output in a variable named RESULT.

Sample Input / Output:

Input: The value of N in between $2 \sim 9$ The result is: 285

3. Write an assembly code to sort the following data in ascending order using any sorting algorithm.

Sample Input: Sample Output:

2 6 1 9 4 The sorted list is: 1 2 4 6 9
